

Final Project Proposal
Tarot Card Readings

chrysanthemumtea's Tarot Card Reading will have two phases: a reception and a consultation.

At the reception phase, users will have the choice to schedule an appointment or to check in to their appointment. When a user schedules an appointment, an instance of the Appointment class will be created with their name and appointment time and stored in an ArrayList. When a user attempts to check in to the appointment, the reception desk will go through the appointments in the ArrayList and try to find the matching appointment. If it exists, they will move on to the consultation phase.

Once the user passes the reception phase, the consultation phase begins. The user will interact with the tarot card reader by asking them a question. The tarot card reader will shuffle the cards. Then, the reader will draw the number of cards the user chose (either 3, 7, 10, or 12). Each card that is drawn will have a description accompanying it. The user will interpret the description as it pertains to the question they asked the reader.
